

Project Part 2

Computational Visual Perception (CompVP)

Bernhard Egger, Andreas Kist, Patrick Krauß, Tim Weyrich

How to complete module

- 7,5 ECTS
 - 5+2,5 ECTS
 - You need both!
 - You can't get only 5 or only 2,5 ECTS

Overall project goal

- How much of vision do SotA generative video models “solve”?
- How well do they and other models work for corner cases of vision?

Video models are zero-shot learners and reasoners

Thaddäus Wiedemer^{*1}, Yuxuan Li¹, Paul Vicol¹, Shixiang Shane Gu¹, Nick Matarese¹, Kevin Swersky¹,
Been Kim¹, Priyank Jaini^{*1} and Robert Geirhos^{*1}

¹Google DeepMind

The remarkable zero-shot capabilities of Large Language Models (LLMs) have propelled natural language processing from task-specific models to unified, generalist foundation models. This transformation emerged from simple primitives: large, generative models trained on web-scale data. Curiously, the same primitives apply to today's generative video models. Could video models be on a trajectory towards general-purpose *vision* understanding, much like LLMs developed general-purpose *language* understanding? We demonstrate that Veo 3 can solve a broad variety of tasks it wasn't explicitly trained for: segmenting objects, detecting edges, editing images, understanding physical properties, recognizing object affordances, simulating tool use, and more. These abilities to perceive, model, and manipulate the visual world enable early forms of visual reasoning like maze and symmetry solving. Veo's emergent zero-shot capabilities indicate that video models are on a path to becoming unified, generalist vision foundation models.

Illusory Motion Reproduced by Deep Neural Networks Trained for Prediction

Eiji Watanabe^{1,2*}, Akiyoshi Kitaoka³, Kiwako Sakamoto^{4,5}, Masaki Yasugi¹ and Kenta Tanaka⁶

¹ Laboratory of Neurophysiology, National Institute for Basic Biology, Okazaki, Japan, ² Department of Basic Biology, The Graduate University for Advanced Studies (SOKENDAI), Miura, Japan, ³ Department of Psychology, Ritsumeikan University, Kyoto, Japan, ⁴ Department of Physiological Sciences, The Graduate University for Advanced Studies (SOKENDAI), Miura, Japan, ⁵ Division of Integrative Physiology, National Institute for Physiological Sciences (NIPS), Okazaki, Japan, ⁶ Sakura Research Office, Wako, Japan

The cerebral cortex predicts visual motion to adapt human behavior to surrounding objects moving in real time. Although the underlying mechanisms are still unknown, predictive coding is one of the leading theories. Predictive coding assumes that the brain's internal models (which are acquired through learning) predict the visual world at all times and that errors between the prediction and the actual sensory input further refine

- Project Part 1: Play around with video diffusion models and reproduce paper
(close to Paper 1)
- Project Part 2: Experiment further with illusions, optical flow and depth estimation
(close to paper 2)
- Project Part 3: Further Evaluation based on results of Part 1 and Part 2
(close to paper 1 and 2)

Introducing
Nano Banana Pro

What happened since?

sid

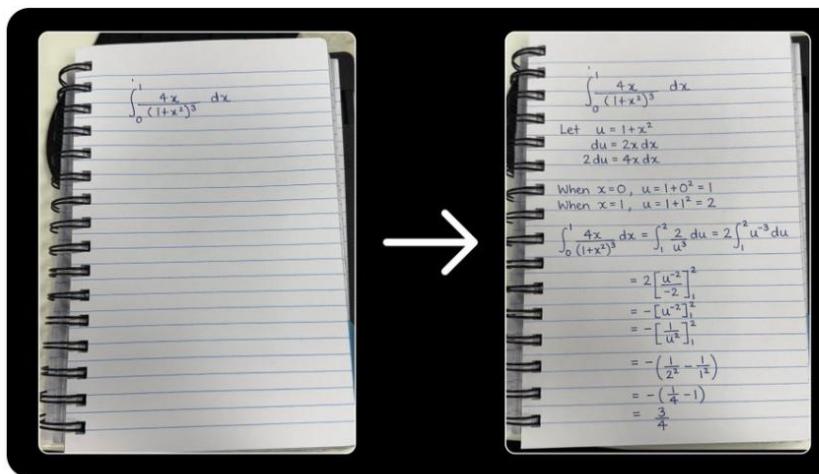

@immasiddx

Google's Nano Banana Pro is by far the best image generation AI out there.

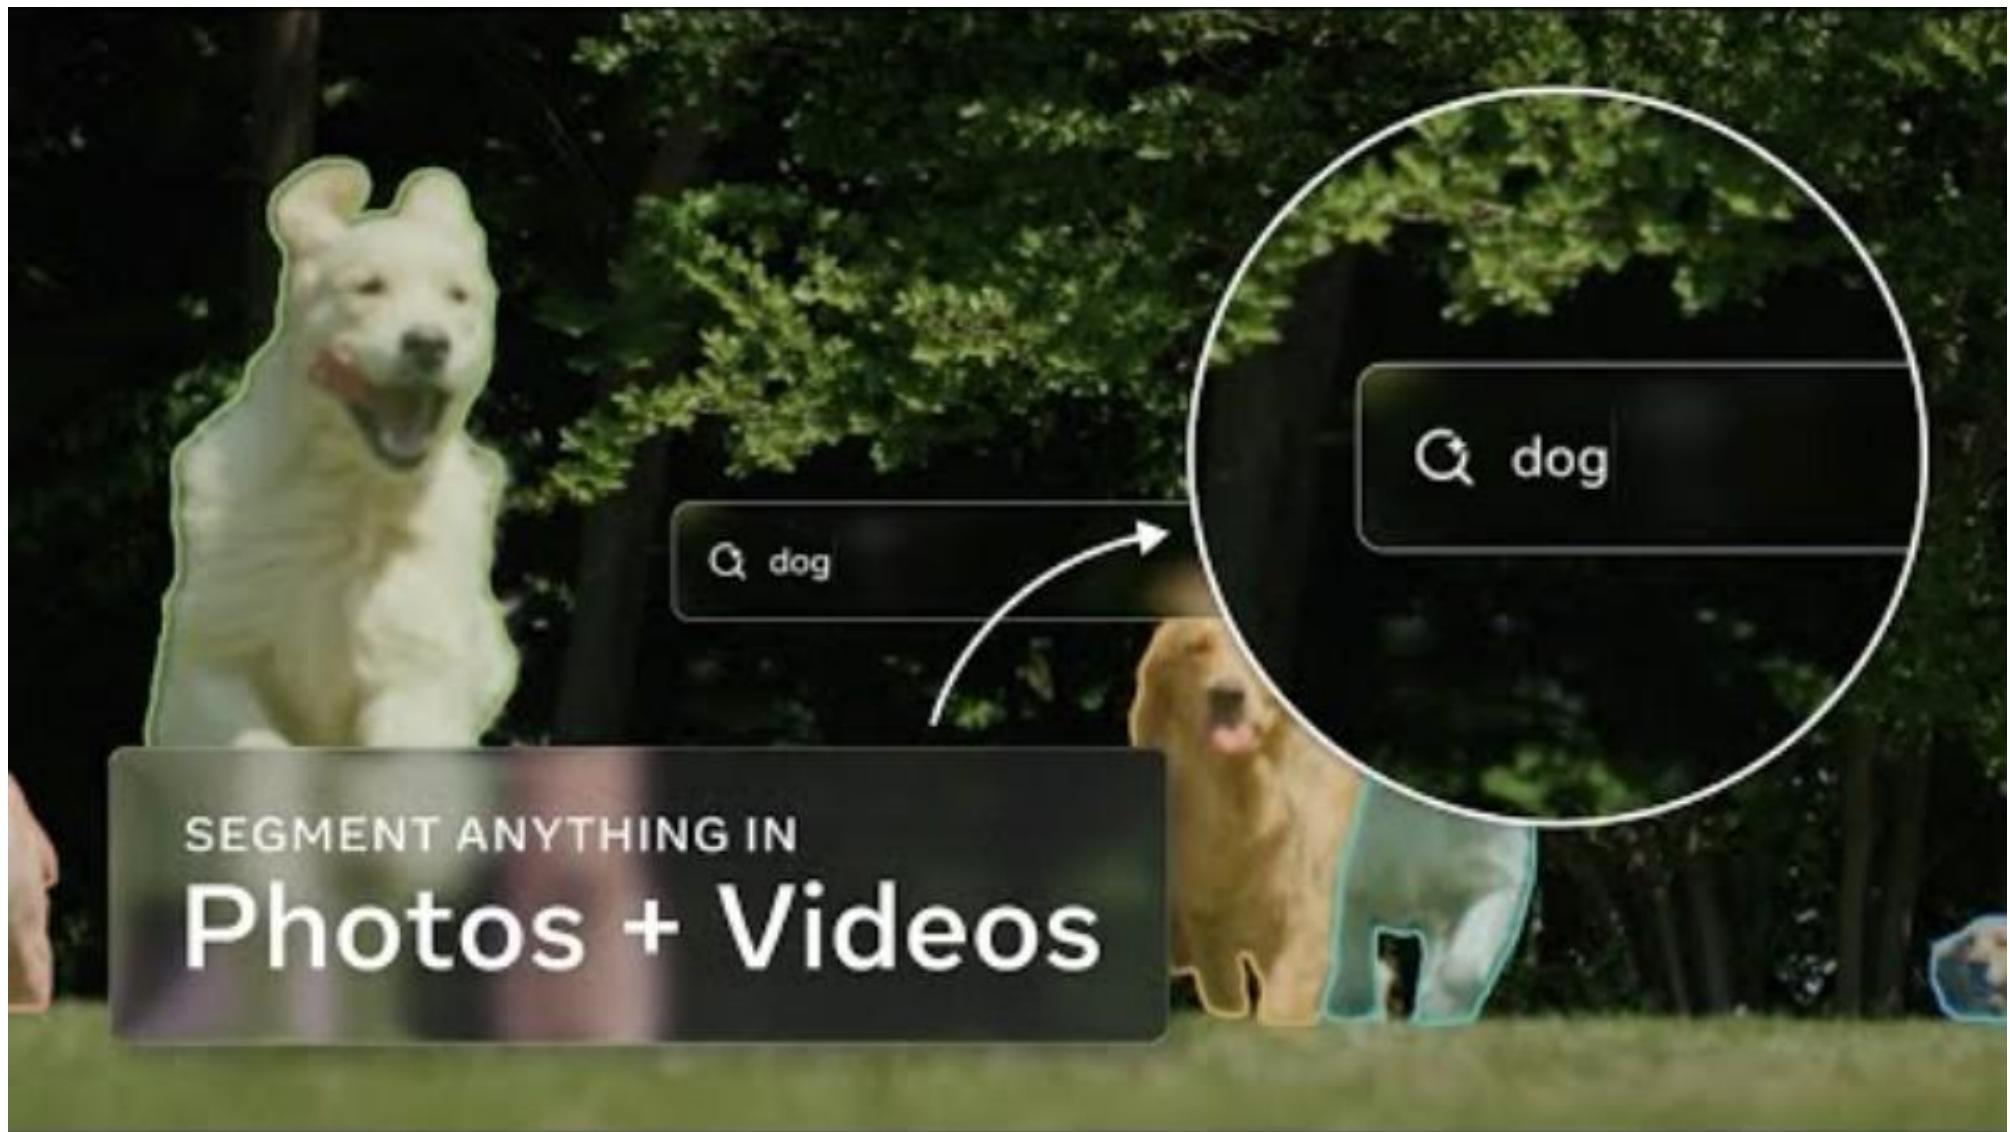

I gave it a picture of a question and it solved it correctly in my actual handwriting.

Students are going to love this. 😂

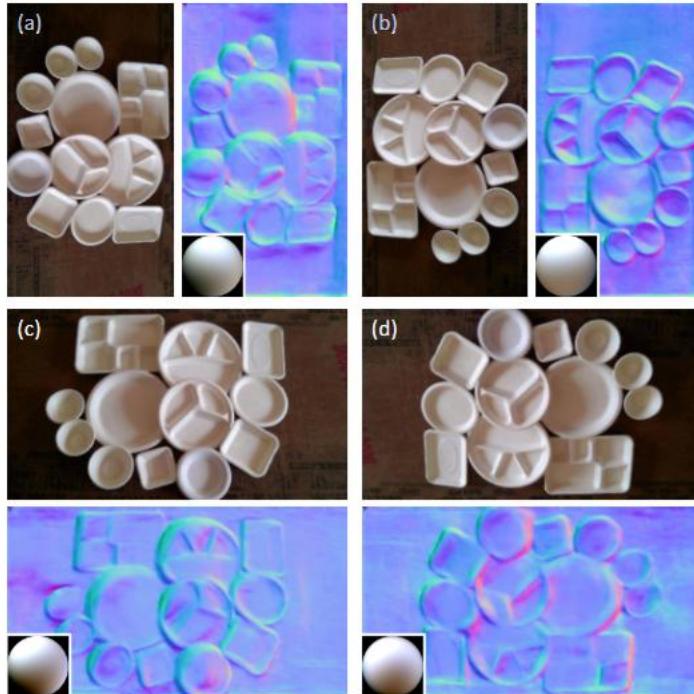

Fig. 16: Shape estimation results on the plates shading illusion. For four orientations of the image (a-d) we show the input image and the estimated normal map with estimated lighting inset.

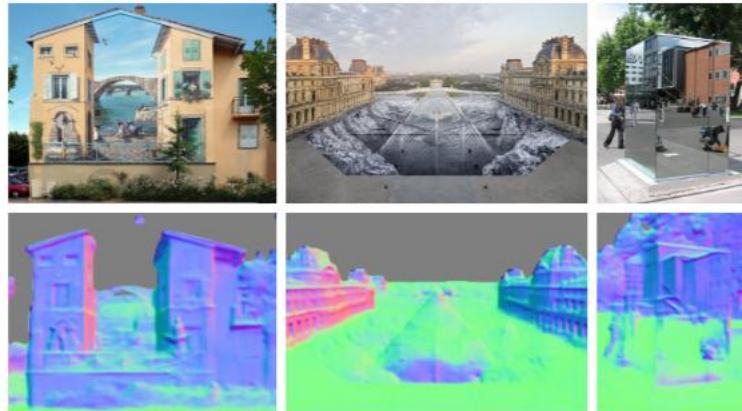

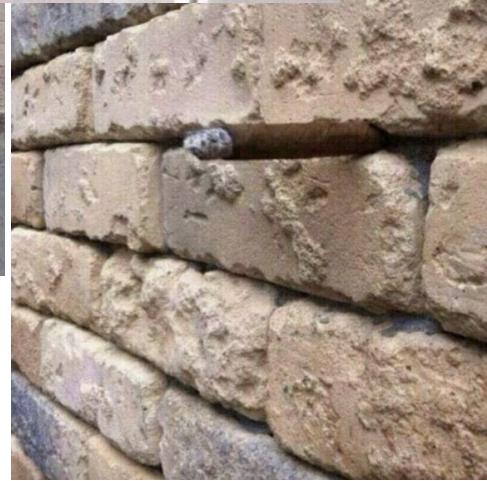

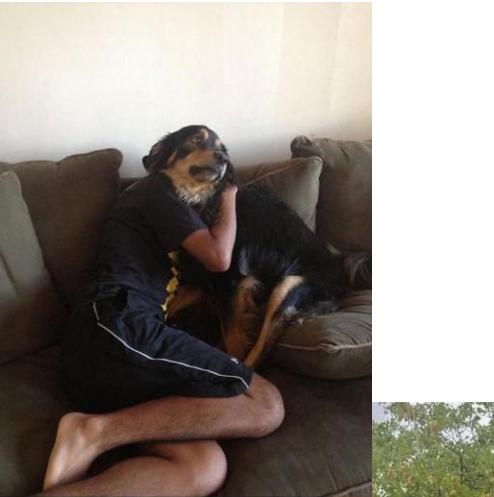

Fig. 18: Shape estimation in the presence of Trompe-l'oeil and mirror illusions.

l'œil illusions and one for a mirror illusion. Trompe-l'œil use albedo variations (i.e. painted surface texture) to depict 3D scenes, giving the illusion of additional geometric variation. A mirror illusion is similar except that the albedo variation is a reflection of another part of the real scene. In all examples, the shape reconstruction is fooled by the illusion. In the example in the first column, both the sky segmentation network and our inverse rendering network are fooled. The shape of the painted windows, doors and

The Journal of Illusion welcomes your submissions.

<https://www.ritsumei.ac.jp/~akitaoka/index-e.html>

- Submission via Studon course:
“Computational Visual Perception”
- Submission has to be in the exact format
- Three strict project deadlines
 - November 21st,
 - January 2nd (feel free to submit early),
 - February 5th

How to pass

- Pass/Fail for each of the 3 parts,
 - You need to pass 2 out of 3 parts
-
- The best solutions for each part will be released ~ 1 week after the deadline, to enable others to continue with the best solution of another team

- Scope of project ~ 150 hours per student
 - Teams of 1-3 students
 - Steps can be performed in new group
-
- If you are looking for a group, please stay after the class and talk to people who also stay
 - If you are looking for a group and can only join virtually, please use the forum in “Computational Visual Perception” to team up
-
- Finding a group is your responsibility

Part 2 Options

- Play around with:
 - Image generation (based on input image, e.g. nanobanana)
 - Video generation (similar to Part1)
 - Segmentation (e.g. SAM3)
 - 3D Reconstruction (e.g. SAM3D or Gen3DSR)
 - 3D Reconstruction bodies (e.g. SAM3D or PLIKS))
 - Optical Flow (e.g. FLOWSEEK)
 - Depth/Normal Estimation (e.g. Marigold 2, DepthAnything)
- Choose ≥ 2 and play around
- Come up with your own research question(s)
- Run it on your own (not just cloud-ui)

Part 2 deliverables

- Per project team 1 single pptx file (or powerpoint compatible)
- The pptx file contains:
 - Option 1 Formulated Research Question(s)
 - Experiments for your chosen option 1 for at least 5 images
 - 1 slide summarizing what you observed for your option 1
 - Option 2 Formulated Research Question(s)
 - Experiments for your chosen option 2 for at least 5 images
 - 1 slide summarizing what you observed for your option 2
 - Screenshot for both option 1 and option 2 how your interface works (e.g. terminal)
- (ideally all videos are set to play automatically)

- In Studon course :
“Computational Visual Perception”
- You will upload up to ~1GB (don’t!)
Plan in internet speed, upload at university

If you run into issues uploading, you send an md5 hash of your zip file **before** the deadline and you provide an alternative download link within 24h

Part 2 grading

- Correct format
 - Option 1
 - Formulated Research Question(s) for Part 1
 - Summary text 1
 - Option 2
 - Formulated Research Question(s) for Part 2
 - Summary text 2
 - Proof for own interface
-
- Selected solution: all points fulfilled to full satisfaction
 - Pass: at most one bullet point from the above missing
-
- Plagiarism will have serious consequences

- Project Part 1: Play around with video diffusion models and reproduce paper
(close to Paper 1)
- Project Part 2: Experiment further with illusions, optical flow and depth estimation
(close to paper 2)
- Project Part 3: Further Evaluation based on results of Part 1 and Part 2
(close to paper 1 and 2)

- You can ask questions in the forum
“Computational Visual Perception”
- You come with concrete questions
- I'll open a thread in the forum, where you can respond till Thursday each week if you want to meet
- I'll distribute time slots each Friday
- No guarantee for any responses on the day of the deadline

How to complete module

- 7,5 ECTS
 - 5+2,5 ECTS
 - You need both!
 - You can't get only 5 or only 2,5 ECTS

PROCRASTINATION
